```
The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptom comprises messenger RNAs transcribed from multiple comprises messenger RNAs transcribed from multiple comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a proposical sample, in expression profiling studies, in qualitatively or quantitatively characteristing the corresponding transcriptom, and in cetecting RNA transcripts and splice variants of human or animal transcripts and splice variants of human or animal content and pathological state, and so allowing the detection of tissue and pathology-specific genes such as those genes only expressed in competing to tissue under a specific pathological condition; to detect condition; to devect conditions to developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular cissue condition; to ABNESSESS perpresent oligonucleotide sequences from disorder. ABNESSES perpresent oligonucleotide sequences from crats, humans and mice, which are used in the exemplification of the principle of the printed specification, but was obtained in electronic format diagrantly, from units of the circuit, in the condition of the manner of the print of the circuit, in the condition of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2337 AAGAGGAGCTGAAGACCCACATCAGCAAGGGTACGCTGGGCAAGTTCACTGTGCCCATGC 2396
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     α
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcribtion unit of genome, useful for detecting tissue-, pathology-, and developmental-specific genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human spliced transcript detection oligonucleotide SEQ ID NO:31970.

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptom comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The coligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries are useful for detecting mRNA transcripts and splice variants of human or animal constitutions. The libraries may also be used as specialised minical libraries to detect transcripts of a sub-transcriptome under a particular colibraries to detect transcripts of a sub-transcriptom under a particular coliological or pathological state, and so allowing the detection of tissue specific tissue under a specific pathological condition; to detect developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular colisconder. ABN73753 to ABN75589 represent oligonucleotide sequences from cates, humans and mice, which are used in the exemplification of the print of the printed specifician of the printed specification, but was obtained in ole form directly from with a specification, but was obtained in olectronic format directly. 1051 ö 9 992 GCAAAACGAATTCTAGAGCTTGACCAGTTTAAGGGGCAGCAGGGACAAAAACGTTTCCAA GCAAAACGAATTCTAGAGCTTGACCAGTTTAAGGGGCAGCAGGGACAAAAAAGGTTTCCAA 0; Gaps Human spliced transcript detection oligonucleotide SEQ ID NO:6003. specific genes.

The present invention describes oligonucleotide libraries for detecting

CC messenger RNAs that populate a (sub-)transcriptome, where the (subltranscriptome comprises messenger RNAs transcribed from multiple
cc transcription units that populate a genome. The library comprises several
coligomucleotides, each capable of bybridising selectively to a set of
messenger RNAs transcribed from a given transcription unit of the genome,
which encodes one or more messenger RNA splice variants. The
coligomucleotide libraries are useful for detecting mRNAs from a

(CELL-) CELLOMICS INC.

New recombinant fusion protein comprising detection and first localization domains and a binding domain for the molecule of interest, useful for detecting binding of a molecule of interest.

Claim 20; SEQ ID NO 164; 101pp; English

The present invention describes a recombinant fusion protein (I) for

detecting binding of a molecule of interest. (I) comprises: (a) a detection domain; (b) a first localisation domain; and (c) a binding comain for the molecule of interest. The detection domain the first localisation domain and the binding domain for the molecule of interest constituting the recombinant fusion protein for detecting binding of a molecule of interest are operably linked. The binding domain for the molecule of interest is separated from the first localisation domain by 0 -20 amino acid residues. The first localisation domain by 0 c-20 amino acid residues. The first localisation domain by 0 c-20 amino acid residues. The first localisation domain for the molecule of interest both do not occur in a single non-recombinant for the molecule of interest. Also described:

(1) a recombinant nucleic acid encoding the recombinant fusion protein;

(2) a recombinant expression vector comprising the nucleic acid control sequences operably linked to the recombinant nucleic acid molecule; (3) a genetically engineered host cell transfected with the recombinant control sequences operably linked to the recombinant mucleic acid molecule; (3) a genetically engineered host cell transfected with the recombinant control interest; and (5) a method for identifying compounds that alter the interest; and (5) a method for identifying compounds that alter the binding of the molecule of interest. The recombinant control is useful for detecting binding of a molecule of interest. The recombinant controls and enables the molecule of construct two or more ofineering the construct who or more ofineering and enables the molecule of construct two or more ofineering the construct when an enables in the molecule of interest in the molecule of interest. proteins and enables the monitoring of biochemical events in live, intact or fixed cells. The present sequence is used in the exemplification of the present invention.

New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.

Claim 1; Page 547; Opp; English

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ0815) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection

Sequence polymorphism-based analysis of nucleic acid sequences can augment or replace previously known methods for determining the identity and relatedness of individuals. Single nucleotide polymorphisms (SNPs) tend to occur with great frequency throughout the genome and may be located close to loci of interest. Such variations cause or be closely linked to pathological conditions (genetic diseases). Hence the SNPs of the invention may be useful in the development of compounds with cytostatic, immunosuppressive, antiinflammatory, neuroprotective or antimicrobial activities. Regulators of metabolic pathways such as fatty acid
                                                                                                                                                                                                                                                                                                                                                                                                                                              sequence polymorphism analysis; human identity; human relatedness;

metabolism, glycolysis, and amino acid metabolism may also be developed. The compounds may be useful for treating a subject suffering from or at risk for a pathology associated with the presence of a sequence polymorphism. SNP detection is also useful in paternity analysis and forensic application. Polymorphisms may contribute to the phenotype of an organism and phenotypic traits include genetic diseases such as autoimmune diseases, cancer, diseases of the nervous system and infection by pathogenic microorganisms. The present sequence is the sequence surrounding and including a human SNP of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence polymorphism analysis; human identity; human relatedness; single nucleotide polymorphism; SNP; genetic disease; cytostatic; immunosuppressive; antiinflammatory; neuroprotective; antimicrobial; fatty acid metabolism; glycolysis; amino acid metabolism; paternity analysis; forensic; autoimmune disease; cancer; nervous system; infection; pathogenic microorganism; human; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to novel isolated nucleotide sequences which comprise 217 defined polymorphic sequences. Sequence polymorphism-based analysis of nucleic acid sequences can augment or replace previously known methods for determining the identity and relatedness of individuals. Single nucleotide polymorphisms (SNPs) tend to occur with

great frequency throughout the genome and may be located close to loci of interest. Such variations can cause or be closely linked to pathological conditions (genetic diseases). Hence the SNPs of the invention may be useful in the development of compounds with cytostatic, may be activities. Regulators of metabolic pathways such as fatty acid metabolism, glycolysis, and amino acid metabolism may also be developed. The compounds may be useful for treating a subject suffering from or at risk for a pathology associated with the presence of a sequence polymorphism. SNP detection is also useful in paternity analysis and forensic application. Polymorphisms may contribute to the phenotype of an organism and phenotypic traits include genetic diseases such as autoimmune diseases, cancer, diseases of the nervous system and infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 T7; leukocyte; gene expression profiling; allograft rejection; atherosclerosis; congestive heart failure; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Phillips J;
                                                                                                                                                                                                                                                                     by pathogenic microorganisms. The present sequence is the sequence surrounding and including a human SNP of the invention.

predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, to treatment in an individual. The disease include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17, leukocyte; gene expression profiling; allograft rejection; atherosclerosis; congestive heart failure; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nitoring (the rate of) progression of a disease, e.g. atherosclerosis congestive heart failure, comprises diagnostic oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Phillips J;

The present invention relates to a method (M1) for detecting and/or isolating a nucleic acid having a homopolymeric sequence or repetitive element or conserved nucleotide sequence. (M1) comprises treating a sample containing nucleic acid compounds with an locked nucleic acid acid compounds with an locked nucleic acid acid having the homopolymeric sequence or repetitive element or conserved nucleotide sequence. (M1) is useful for detecting and isolating nucleic acids released from a lysed complex biological mixture comprising nucleic acids. The present sequence is a LNA capture probe, used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting and/or isolating nucleic acid molecule having homopolymeric sequence or repetitive element or conserved nucleotide sequence involves treating sample containing nucleic acid compounds with locked nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, laver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                                                                                                                                                                                                                                                                                                  17; leukocyte; gene expression profiling; allograft rejection; atherosclerosis; congestive heart failure; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Phillips J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to novel conjugates comprising 1-100 nucleotide or nucleoside molecules coupled to a label through water-soluble polymer linkers. The conjugates of the invention may be useful for modifying nucleic acid chains via coupling reactions catalyzed by DNA polymerase, RNA polymerase or terminal transferase enzymes or by phosphoramidite coupling, e.g. for labeling nucleic acids in arrays bound to a solid phase. The current sequence is that of the Cy3-labeled polynucleotide

This invention relates to a novel method for parallel sequence analysis of nucleic acids (NA) by optical means using a novel solid phase (SP). The SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids, so the background remains low even after prolonged and respected contact of the solid phase with high concentrations of labeled reagents. The present sequence is that of an oligonucleotide which was used in the development of the novel method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Parallel sequencing of nucleic acids by optical methods, by cyclic primer -matrix extension, using a solid phase with reduced non-specific binding of labeled components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ss; dna detection; DNA sequencing; DNA amplification; oligo dT35-Cy3.

                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                              washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process that the process able to determine many sequences in their claimed is that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide dT35-Cy3 which was used in the development of the novel process of the invention.
                                                                                                                                                                                  This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hepatitis C virus; RNA virus; replication; viral infection; PCR primer;
                                                                                                                                     Ultra-high parallel analysis process to analyse nucleic acid chains in which a sample solid is bound and substrate material.
                                                                                                                                                                                                                                                                                                                                                               Gaps

The method is for analyzing probe supports or nucleic acid chips with detection and quantitation of probe conditions and hybrid of probe with target nucleic acid, which is
                                                                                                                                                                                                     The present invention describes a vector comprising a cDNA encoding an RNA virus gene, constructed to ensure the exact and homogeneous transcription of both terminals of the RNA virus gene. Also described is a method for screening drugs for inhibiting the replication of RNA virus by using the RNA viral infection model animal, particularly one with hepatitis C viral infection. The vector is useful in clarifying the mechanism of RNA viral replication, onset of RNA viral infection, and developing remedies and therapeutics for RNA viral infection, and particularly of a hepatitis C virus. The present sequence represents a PCR primer which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Analysis of probe supports or nucleic acids on nucleic acid chips by halogen-based time-of-flight secondary-ion mass spectrometry, applicable in gene analysis, disease diagnosis and species identification.
Vectors expressing full-length gene of RNA viruses, useful in clarifying mechanisms of RNA viral replication, infection, and developing remedies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           secondary-ion mass spectrometry, gene analysis; disease diagnosis; species identification; ss; probe.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HIV; thiolation; reverse transcriptase; primer; inhibition; homooligomer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       region (d(T)12) to promote the binding of the remaining portion of the E-thiolated oligonucleotride (MdV 28) to a homopurine site of the viral genome via triple-helix formations. The oligo is used to in the treatment of HIV. See also AAQ22624-27 and AAQ25017-Q25032
applicable in gene analysis, disease diagnosis and species identification. The present sequence represents a probe sequence used hybridization tests.

```
This invention describes a novel method for enhancing translation of a coding region which involves making an RNA molecule, comprising the coding region operably linked to a 5' untranslated region (UTR) to comprising a sequence fully homologous to pestivirus homology box IV, and then translating it so that the translation of the coding region is enhanced. The method is useful for enhancing or controlling the translation of HCV nucleic acid, which allows stronger immune responses, where blocking or decreasing translation of viral nucleic acid may decrease the pathology of viral infection. This sequence represents a primer which is used in the construction of hybrid CAT RNA's described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ă
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enhancing translation of coding region of hepatitis C virus involves making RNA molecule comprising the coding region and 5' untranslated region comprising a sequence fully homologous to pestivirus homology

The invention relates to a DNA microarray for detecting a target nucleic acid molecule in a specimen, comprising a nucleic acid probe that has a target endernee substantially complementary to the base sequence of the target nucleic acid molecule immobilised onto a substrate. The microarrays are applicable in gene analysis, disease diagnosis and species identification. With such reliable microarrays, the detection of target nucleic acid molecules can be conveniently and quickly achieved, with high accuracy and improved reproducibility and quantitation even in a high-throughput system. In the microarray with a matrix shape, it is possible to shown images of distribution of formation density of a nucleic acid probe-dot system. Various internal and external-strandard synches were prepared biologically, by enzyme digestion or cleavage, and synthetically, for immobilisation onto a glass substrate e.g. after screen-printing at defined density distribution in a pattern. The current
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequence represents a probe related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 40 BP; 0 A; 0 C; 0 G; 40 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a probe support containing a nucleic probe region having nucleic probes fixed to it. Also described is a probe support analysis method. The probe support can be used for the TOF-SIMS analysis of nucleic acid probes by forming a phosphorus-containing region usable as a standard on a substrate, nucleic probes located as a matrix on a nucleic acid chip substrate can be accurately and quantitatively analysed. The support enables accurate analysis. The present sequence represents a probe which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Probe support contains nucleic probe region having nucleic probes fixed therein and enables accurate analysis of probes using TOP-SIMS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Seguence 40 BP; 0 A; 0 C; 0 G; 40 T; 0 U; 0 Other;

This invention relates to a novel method of detecting a nucleic acid base

```
sequence, which comprises fixing on board a partial structure cut by light within the 5' side of primer, adding a target nucleic acid as a template, performing annualing to form a hybrid, extending the hybrid using four sorts of dideoxy nucleotide triphosphate, deoxynucleotide triphosphate, removing the template, irradiating with light and analysing the sequence of extension part based molecular weight obtained by mass spectrometry. The invention is useful for determining the base sequence of a number of nucleic acids effectively and efficiently in a short time.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel analytical method to target nucleic acid molecules in a sample. Specifically, it refers to a DNA probe carrier that has two or more types of probe that are complementary to the base sequence of the target RNA molecule such that the hybrid structure can subsequently be identified by secondary ion mass spectroscopy time of flight. The present invention describes a method that overcomes the problems associated with using radioactive isotopes or fluorescence to identify the nucleic acid molecules of interest. Accordingly, this method provides a means for the acquisition of accurate gene information. This oligonucleotide sequence is a target RNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Analysis of target nucleic acid e.g., RNA or DNA, by making sample react with probe carrier having probes complementary to target and detecting the hybrid by time-of-flight type secondary ion mass spectrometry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA probe carrier; secondary ion mass spectroscopy time of flight; ss; nucelic acid detection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel analytical method to target nucleic acid molecules in a sample. Specifically, it refers to a DNA probe carrier that has two or more types of probe that are complementary to the base sequence of the target RNA molecule such that the hybrid structure an subsequently be identified by secondary ion mass spectroscopy time of flight. The present invention describes a method that overcomes the problem associated with using radioactive isotopes or fluorescence to identify the nucleic acid molecules of interest. Accordingly, this method provides a means for the acquisition of accurace gene information. This oligonucleotide sequence is a DNA probe of the invention. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analysis of target nucleic acid e.g., RNA or DNA, by making sample react with probe carrier having probes complementary to target and detecting the hybrid by time-of-flight type secondary ion mass spectrometry.

This invention relates to a novel method for developing nucleic acid chip substrates. Specifically, it refers to a chip that comprises a nucleic acid probe and related nucleic acid substances arranged in a matrix form on the chip substrate surface. The present invention describes observing binding to the nucleic acid probe by an environment-control type scanning electron microscope and determining the quality of the dot shape produced. This oligonucleotide sequence is a DNA probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid chip substrate, comprising nucleic acid probe and related nucleic acid substances arranged in matrix form on substrate surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nucleic acid chip substrate; probe; matrix;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method of analysing a substance on a substrate using mass spectrometry (MALDI-TOF MS). The method involves using a structure including a partial structure to be disconnected by light to fix the substance on the substrate, irradiating the substance partial structure to be disconnected by light, and analysing the mass spectrum of the substance which is brought in an unfixed state by disconnecting the partial structure by the irradiation of light. The method can be used to acquire data from a bio-chip. The present sequence is a probe used to demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Acquiring mass of immobilized substance, using mass spectrometry, by fixing substance to substrate using partial structure to be disconnected by light in bonded part, analyzing mass spectrum of substance after disconnecting structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                         This invention relates to a novel method for developing nucleic acid chip substrates. Specifically, it refers to a chip that comprises a nucleic acid probe and related nucleic acid substances arranged in a matrix form on the chip substrate surface. The present invention describes observing binding to the nucleic acid probe by an environment-control type scanning electron microscope and determining the quality of the dot shape produced. This oligonucleotide sequence is a DNA probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method for testing the surface state of an organic device used in manufacturing. Specifically, it refers to an organic device organization of a sample holding base (SB) that can be detected by using an X-ray source to centre on and measure the position of the sample holding base by identifying the specific angle of reflection. The present invention describes an organic film that contains a number of bio-related substances such as a biochip
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Testing surface state of organic device in manufacturing organic device has organic film containing organic compound having sample holding base
                                                                                                                                    comprising nucleic acid probe and related

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a probe immobilised substrate and a method for its manufacture. The probes can be located using a surface analysis method e.g. scanning electron microscopy, atomic force microscopy, and time-of-flight secondary ion mass spectrometry (TOP-SIMS) method. The invention also discloses a method for analysing the probe array, and a method for detecting the probe and target material. The invention is useful for probe immobilised substrates such as DNA probes such as single strand DNA probes, single strand RNA probes, single strand peptide nucleic acid (PNA) probes, protein probes for genome analysis and peptide nucleic acid (PNA) probes, protein probes for genome analysis and determination of therapeutic strategies, using electron microscopy, photoelectron spectroscopy, atomic force microscopy, and TOP-SIMS. The
                   s analysed repeatedly in a high
sequence is a labelled DNA probe
arranged in matrix form on the substrate. In the manufacturing process, the laminated film of the biochip can be analysed repeatedly in a high throughput manner. This oligonucleotide sequence is a labelled DNA probused in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Probe immobilised substrate; surface analysis method; scanning electron microscopy; time-of-flight secondary ion mass spectrometry; TOF-SIMS; probe array; genome analysis; gene expression analysis; cancer; hereditary disease;

                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to detecting a probe located and/or a target capable of binding specifically to the probe on a substrate comprises the preparation of a substrate with the probe and/or the target for specific binding to the probe on its surface, and measurement of the substrate surface by time- of-flight secondary-ion mass spectrometry with labeling. The method is for analyzing probe supports or nucleic acids on nucleic acid chips with detection and quantitation of probe conditions and hybrid of probe with target nucleic acid, which is applicable in gene analysis, disease diagnosis and species identification. The present sequence represents a probe sequence used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis of probe supports or nucleic acids on nucleic acid chips by halogen-based time-of-flight secondary-ion mass spectrometry, applicable in gene analysis, disease diagnosis and species identification.
invention reduces the time for searching the positions of probe array spots, hence reliable images are obtained quickly, thereby enabling efficient and accurate analysis, at low cost. The present sequence represents a DNA probe used in the exemplification of the present
                                                                                                                                                                                    Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          secondary-ion mass spectrometry; gene analysis; disease diagnosis; species identification; 88; probe.

```
The present invention relates to detecting a probe located and/or a target capable of binding specifically to the probe on a substrate comprises the preparation of a substrate with the probe and/or the target for specific binding to the probe located on its surface, and measurement of the substrate surface by time- of-flight secondary-ion mass spectrometry with labeling. The method is for analyzing probe supports or nucleic acids on nucleic acid chips with detection and quantitation of probe conditions and hybrid of probe with target nucleic acid, which is applicable in gene analysis, disease diagnosis and species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Analysis of probe supports or nucleic acids on nucleic acid chips by halogen-based time-of-flight secondary-ion mass spectrometry, applicable in gene analysis, disease diagnosis and species identification.

The present invention relates to detecting a probe located and/or a target capable of binding specifically to the probe on a substrate comprises the preparation of a substrate with the probe and/or the target for specific binding to the probe located on its surface, and measurement of the substrate surface by time- of-flight secondary-ion mass spectrometry with labeling. The method is for analyzing probe supports or nucleic acids on nucleic acids chips with detection and quantitation of probe conditions and hybrid of probe with target nucleic acid, which is applicable in gene analysis, disease diagnosis and species identification. The present sequence represents a probe sequence used for hybridization tests.
                                                                                                                                                                                     Analysis of probe supports or nucleic acids on nucleic acid chips by halogen-based time-of-flight secondary-ion mass spectrometry, applicable in gene analysis, disease diagnosis and species identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Analysis of probe supports or nucleic acids on nucleic acid chips by halogen-based time-of-flight secondary-ion mass spectrometry, applicable in gene analysis, disease diagnosis and species identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            spectrometry; gene analysis; disease diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to detecting a probe located and/or a target capable of binding specifically to the probe on a substrate comprises the preparation of a substrate with the probe and/or the target for specific binding to the probe located on its surface, and measurement of the substrate surface by time- of-flight secondary-ion mass spectrometry with labeling. The method is for analyzing probe supports or nucleic acids on nucleic acid chips with detection and quantitation of probe conditions and hybrid of probe with target nucleic acid, which is applicable in gene analysis, disease diagnosis and species identification. The present sequence represents a target sequence used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Analysis of probe supports or nucleic acids on nucleic acid chips by halogen-based time-of-flight secondary-ion mass spectrometry, applicable in gene analysis, disease diagnosis and species identification.

The present invention relates to detecting a probe located and/or a target capable of binding specifically to the probe on a substrate comprises the preparation of a substrate with the probe and/or the target for specific binding to the probe located on its surface, and measurement of the substrate surface by time- of-flight secondary-ion mass spectrometry with labeling. The method is for analyzing probe supports or nucleic acids on nucleic acid chips with detection and quantitation of probe conditions and hybrid of probe with target uncleic acid, which is applicable in gene analysis, disease diagnosis and species identification. The present sequence represents a target sequence used for hybridization tests.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Probe for measuring device of intermolecular interaction of organic
molecule, comprises probe portion coated with electroconductive film and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modified nucleic acid used in intermolecular interaction measurement #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a probe comprising a probe portion (3) coated with an electroconductive film (4) and an organic film (5) by chemical bonds through a sulfur atom. Further disclosed is a method for manufacture of the probe, and a method for measuring intermolecular interactions. The method of the invention is useful for creating a measuring device e.g. scanning probe microscope (SPM) and atomic force microscope (AFM) used for measuring an intermolecular interaction in samples, such as organic molecules e.g. deoxyribonucleic acid (DNA).

```
The invention relates to a probe comprising a probe portion (3) coated with an electroconductive film (4) and an organic film (5) by chemical bonds through a sulfur atom. Purther disclosed is a method for menthod for measuring intermolecular interactions. The method of the invention is useful for creating a measuring device e.g. scanning probe microscope (SPM) and atomic force microscope (APM) used for measuring an intermolecular interaction in samples, such as organic molecules e.g. deoxyribonucleic acid (DNA). Probes of the invention enable stable measurement of organic molecules fixed on substrate by a simple structure. The current sequence represents a nucleic acid sequence used in an example of the invention.
                                                                                                                                ö

The new invention relates to a method for detecting (M1) a target gene having a specific sequence in a specimen, by adding a single-stranded comparing a sequence in a specimen, by adding a single-stranded comparing a sequence of the target, therefore forming double-stranded complementary sequence of the target, therefore forming double-stranded complementary sequence of the target, therefore forming double-stranded complementary sequence of the intercalator binds with double-stranded nucleic acid and detecting intercalator bound nucleic acid. Also claimed are a gene detector, which detects a gene having a specific sequence, in a specimen. In (M1), the electrochemical measurement applies voltage with the electrochemical is specific acid is covalently bonded with the compound which as the intercalating agent, is measured. The intercalating agent is specifically inserted in the double-stranded nucleic acid, where the intercalating agent includes a compound which has the double-stranded nucleic acid by the double-stranded nucleic acid by ilght irradiation, the electrochemical active site which has electrochemical activity, and the connection region which connects the councer the interchemical activity, and the connection region and the electrochemical active site. (M1) is useful in gene diagnosis and/or infectious disease diagnosis. The new sequence is a 40mer poly-A detecting DNA probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting target gene with specific sequence by adding intercalator to double-stranded nucleic acid formed by adding sample having single-stranded target, to probe, performing photo irradiation and detecting intercalator bound nucleic acid.
                                                                                                                                                                                                                                                                                                                     DNA detection; hybridization; diagnosis; infection; antimicrobial;

The new invention relates to a gene detection method. Specifically described is a method of detecting single stranded probes on an electrode, described is a method of detecting single stranded probes on an electrode, adding an intercalating agent to the electrode, hybridizing the sample with the probe to comparison acarying out light irradiation for covalent bonds forming between nucleic acid and agent and detecting agent forming a covalent comprising compounds represented by "Lb-Ib and "Lc-Fb at each of the sites, where Fa and Fb are electrochemically active site having substituent (s) comprising compounds represented by "Lb-Ib and "Lc-Fb at each of the sites, where Fa and Fb are electrochemically active site having substituent (s) comprising compounds represented by "Lb-Ib and "Lc-Fb at each of the sites, where Fa and Fb are electrochemically active site having substituent (s) binding site which is to be inserted specifically into the double comprises acid und is capable of forming a covalent bond with the couple stranded nucleic acid und is capable of forming a covalent bond with the couple stranded nucleic acid und is capable of forming a covalent bond with the computions sites that links the double stranded nucleic acid und is capable of comprises applying a voltage with respect to the electrochemically a compounds. The detection process comprises applying a voltage with respect to the electrochemical light-emission quantity by the covalent bonded double stranded nucleic acid and intercalating agent. The compound that has photosensitivity is a furocoumarin derivative, preferably a psoralen derivative. (MI) is useful in gene diagnosis, infectious diseases confined in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ftp.wipo.int/pub/published pct sequences. The present sequence is a 40-
mer poly A DNA sequence related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to a method for detecting a gene with a specific sequence. The method involves: (a) hybridizing a target nucleic acid to a sequence. The method involves: (a) hybridizing a target nucleic acid to a probe immobilized on an electrode; (b) contacting the resulting duplex with a photoactivatable intercalating agent that has an electrochemical active site; (c) irradiating the complex so that the intercalating agent complex is a covalent bond to the DNA duplex; and (d) detecting the DNA duplex; of an electrochemical measurement (especially electrochemical light emission). The method of the invention is useful for detecting a gene of genese diagnosis and genome based drug discovery. By covalently attaching the intercalating agent to the DNA duplex, the background noise associated with non-specific adsorption of an intercalating agent to double-tranded DNA is reduced, making the method highly sensitive. The present sequence represents a polya (mer used as a control target sequence) and control target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting gene with specific sequence, by denaturing gene sample into single-stranded molecule, reacting single-stranded nucleic acid with nucleic acid probe immobilized on electrode, and electrochemically detecting bound nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Egashira N;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 40 BP; 40 A; 0 C; 0 G; 0 T; 0 U; 0 Other;

The present invention relates to detecting a probe located and/or a target capable of binding specifically to the probe on a substrate comprises the preparation of a substrate with the probe and/or the target for specific binding to the probe located on its surface, and measurement of the substrate surface by time- of-flight secondary-ion mass spectrometry with labeling. The method is for analyzing probe supports or nucleic acids on nucleic acid chips with detection and quantitation of probe conditions and hybrid of probe with target nucleic acid, which is applicable in gene analysis, disease diagnosis and species identification. The present sequence represents a probe sequence used for hybridization tests.
                                                                                                                                                                                                                                                                                                                                                                                                              Analysis of probe supports or nucleic acids on nucleic acid chips by halogen-based time-of-flight secondary-ion mass spectrometry, applicable in gene analysis, disease diagnosis and species identification.

The invention relates to an improved multiplex ligation-dependent amplification method for detecting specific single stranded target cucleic acids in samples using a plurality of probe sets comprising a tucleic acids in samples using a plurality of probe sets comprising a test 2 probes. Each probe comprises a target specific region and a noncomplementary region comprising a primer binding site. The probes in each set are ligated when hybridised to a target nucleic acid and amplified by a primer set. The method is used for detecting a nucleotide polymorphism, especially a single nucleotide polymorphism; detecting multiple single stranded target nucleic acids sequences (through the detection of multiple single stranded nucleic acids in a sample; and detection of a break point region in rearranged nucleic acids. By using a femtomolar amount of the probes, a large number of different probe sets can be used to simultaneously detect and quantify a corresponding large number of target sequences with high specificity. The present DNA sequence is biotin-dial labelled fluorescent oligonucleotide which is used for the hybridisation
                                                                                                                                                                                                                                                                                                                                        An improved multiplex ligation-dependent amplification method for detecting specific single stranded target nucleic acids in samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NS5B; replicon; hepatitis C virus infection; antiinflammatory;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               comprising at least 10 oligonucleotides chosen from oligonucleotide from specification. (I) comprising pl is useful for determining gene capters of a cise of probes informative for disease diagnosis, as given in the specification. (I) comprising pl is useful for determining gene capturers characteristic of a disease or condition or its stage in an corganism, for preparing a test gene transcript pattern, for diagnosing or identifying or monitoring a disease or condition or its stage in an corganism. (I) is useful in diagnosing or identifying or monitoring any condition, aliment, disease or reaction that leads to the relative increase or decrease in the activity of information genes of any organism regardless whether the changes caused by the influence of bacteria, virus, prions, parasites, fungi, drugs or allergens, where the disease or cancer such as lung cancer, breast cancer and stomach cancer. (I) enables analysis of gene expression within cells which provides individual from which the cells are derived. (I) enables early detection of a disease or condition or its stage after the onset of the disease or condition, even years before other subjective or objective symptoms appear. (I) enables prevention of the possibility of poor analysis, e.g., represents a human cDNA probe useful for disease diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human mRNA hybridisation selection reaction biotin-dT3 oligonucleotide.
                                                                                                                                                                                                                                                                                Set of oligonucleotide probes, useful for diagnosing breast cancer or Alzheimer's disease, comprising specific number of oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, multiplex ligation-dependent amplification, amplicon, single nucleotide polymorphism, hybridisation selection reaction; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to a novel method for enhancing the ability of a genotype 2b NSBB sequence to function in a replicon. The method comprises altering either or both the genotype 1b NSBB sequence to encode one or more adaptive mutations, or a genotype 1b NSBB sequence to encode one or adaptive mutations, or a genotype 1b NSBB sequence to encode one or adaptive mutations or a genotype 1b NSBB sequence to encode one or cald (ARB32874) sequence given in the specification. The invention in form with the specification. The invention of a further comprising a given in the specification, The invention of the sequence of a hepatitis C virus (HCV) replicon encoding a fully defined 1394 amino acid (ARB32849) as genotype 2b NSSB encoding nucleic acid (ARB32849) as equence of a genotype 1b replicon, where NSBB contains a Val-218-Ala modification, and substantially all of a genotype contains a Val-218-Ala modification, and substantially all of a genotype C a replicon of one of the method sor chimeric replicon, where the replicon is expressed in the cell. The method has virucide activity. The method is useful for enhancing the ability of a genotype 2b NSSB sequence to the setul for measuring the ability of a genotype 2b NSSB sequence to useful for measuring the ability of a compound to inhibit replicon contains a replicon. The chimeric replicon and recombinant cell are useful for measuring the ability of a compound to inhibit the onset of hepatitis C virus (HCV) infection in a patient. The method is useful convellence represents a primer used in the exemplification of the novel method of the invention.
                                                                                                 Enhancing ability of genotype 2b NS5B sequence to function in replicon for producing replicons containing functional genotype 2b NS5B, and measuring ability of compound to inhibit replicon activity, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                non-structural protein; NS5B; pharmaceutical;

Novel replicase complex comprising hepatitis C virus NSSB replicase, a 3 nucleotide-long template to which a 2 nucleotide-long primer is annealed, and template and primer which do not form a stable duplex in the absence
                                                                                                                        The specification describes non-structural protein NSSB from clinically important hepatitis C virus (HCV) genotypes. NSSB is a RNA-dependent RNA bolymerase. NSSB polypeptides and polymucleotides are useful for evaluating inhibitors of NSSB. These inhibitors may be used to treat HCV infection. PCR primers AEB86390 and AEB86392-AEB86393 were used in a nested PCK reaction to amplify NSSB RNA, with PCR primer AEB86391 as the creverse primer in PCR1. The primers were used for rescue and characterization of NSSB.
                                                       Novel purified hepatitis C virus RNA-dependent RNA polymerase e.g. NS5B polypeptide, useful for evaluating ability of its inhibitor.
                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ‡

ö

The invention relates to a replicase complex comprising a hepatitis C virus (HCV) NSSB replicase protein, a linear nucleic acid template and a complementary nucleic acid primer which is annealed to the 3' terminus of the template, where the template is at least three nucleotides and the primer is two or three nucleotides, and the template and primer do not form a stable duplex in solution in the absence of the HCV NSSB protein.

The complex is useful for detecting HCV replicase activity and permits establishment of sensitive RNA-dependent RNA polymerase assays to screen and evaluate antivital inhibitors and to improve the specificity and efficacy of the inhibitors. The complex is also useful in the development of a reliable system for determining kinetic and thermodynamic constants of HCV NSSB-catalysed nucleotide incorporation and investigation of specifically, the short RNA template and primer pairs are useful in screening assays which are used for determining kinetic, thermodynamic and mechanistic properties of NSSB replication and ultimately in the development of inhibitors of NSSB. Newly identified inhibitors of replicase activity may be used for development and ultimately in the selection and account of inhibitors of NSSB. Newly identified inhibitors of replicase activity may be used for development anti-HCV pharmaceuticals. Sequences ABK99271-ABK99296 represent HCV NSSB replicase RNA synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

RESULT 49 AAL07487 The present invention relates to an assay system for hepatitis C virus (HCV) replicase activity. The assay system comprises an RNA template that has an unstable, small stemloop at the 3' end capable of forming a copyback structure, a HCV non-structural protein 58 (NSSB), ATP, GTP, TP, and UTP nucleoside triphosphates (NTPS), where one of the NTP is radiolabelled and an assay buffer that supports replication activity of NSSB. The invention also relates to the identification of optimal properties of an RNA template for copy-back self-priming RNA synthesis of HCV. This activity can be used to screen for anti-HCV replicase compounds Assay system for hepatitis C virus replicase activity comprises RNA template with unstable, small stemloop capable of forming copy-back structure, viral non-structural protein 5B, nucleoside triphosphates, RNA template, AA used to direct RNA synthesis by HCV RNA polymerase. Hepatitis C virus; HCV replicase; non-structural protein 5B; NS5B; lead compound; RNA polymerase; ss. Example 1; Fig 1A; 10pp; English.

```
optimal RNA templates can be used for developing a system to characterise HCV NSSB polymerase mechanistically and kinetically and for designing small RNA molecules to co-crystallise with HCV NSSB polymerase. The assay system of the invention is useful for detecting HCV replicase activity. The nucleic acid synthesised by NSSB is detected by evaluating an autoradiograph of reaction products separated by gel electrophoresis. The present sequence is RNA template, AA used to direct RNA synthesis by RNA polymerase proteins of HCV, BVDV and polivirus. This sequence is used in the exemplification of the invention

Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a

Human cDNA probe useful for disease diagnosis #472

(first entry)

26-AUG-2004

AD041321;

BP.

ADO41321 standard; cDNA; 40

```
The invention relates to a set (I) of oligonucleotide probes (PI), comprising at least 10 oligonucleotides chosen from oligonucleotide from comprising at least 10 oligonucleotides chosen from oligonucleotide from comprising at least 10 oligonucleotides chosen from oligonucleotide from competition. (I) comprising PI is useful for determining gene expression pattern of a cell, for preparing a standard gene transcript pattern characteristic of a disease or condition or its stage in an or comparism, for preparing a disease or condition or its stage in an originism. (I) is useful in diagnosing or identifying or monitoring any condition, aliment, disease or reaction that leads to the relative condition, parasites, fundin, the activity of information genes of any organism regardless whether the changes caused by the influence of bacteria, virus, parasites, fundi, drugs or allergens, where the diseases confinence such as lung cancer, breast cancer and stomach cancer. (I) cancer such as lung cancer, breast cancer and stomach cancer. (I) cancer such as lung cancer, breast cancer and stomach cancer. (I) cancer such as lung cancer, breast cancer and stomach cancer. (I) cancer such as lung cancer, breast cancer and stomach cancer. (I) cancer such as nalysis of gene expression within cells which provides information on the state of those cells and importantly the state of the individual from which the cells are derived. (I) enables early detection of a disease or condition, even years before other subjective or objective symptoms appear. (I) enables prevention of the possibility of poor analysis, e.g., represents a human cDNA probe useful for disease diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                    Set of oligonucleotide probes, useful for diagnosing breast cancer or Alzheimer's disease, comprising specific number of oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

DNA by: (a) preparing a DNA sample from patients containing the DNA region in which the target polymorphism is located; (b) hybridising to an appropriate oligonucleotide fragment, immobilised on a support; and (c) detecting the hybridised target DNA by mass spectroscopy. The method can be used for the investigation and diagnosis of gene-related diseases. The method allows polymorphisms to be detected rapidly and effectively in a large number of specimens. The present sequence represents an oligonucleotide which is used in an example from the present invention

                                                                                                                                                                     ö
                                  This invention relates to a kit for the detection and typing of small round structured virus (SRSV) strains. The kit contains antibodies directed against peptides represented in sequences AAB49700 - AAB49710, which are each SRSV strain specific. Polynucleotide sequences AAF20141 - AAF20151 represent cDNA encoding the strain specific proteins. The kit is sueed for detecting and typing strains of SRSV in order to prevent the spread of infection and to examine the epidemiology of outbreaks. PCR primers AAF29152 - AAF29163 are used to amplify SRSV strain specific CDNA
                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                             Multisignal labeling reagent associated oligonucleotide seqid 1.
                                                                                                                                                                                                                                                                                                                               labeling molecule; solubility; multisignal labeling reagent; ss; DNA-RNA hybrid.

The invention describes a composition (1) of matter comprising an oligomer or polymer having two or more labeled groups, where the label or oligomer or polymer, one or more labels are chemically linked to the oligomer or polymer, one or more reactive groups, and one or more charged groups where the charged groups are covalently linked to the oligomer or polymer or comprise part of the backbone of the oligomer or polymer, or any of their combination. Also described are: a composition (II) comprising a target molecule that has been labeled using (I); and a composition (III) prepared by a target of labeling reagent having the formula (FI) or (F2), (II) reacting the target and the labeling reagent to form the composition having the correcting or guantifying an analyte in a specimen; and detecting or quantifying an analyte in a specimen; and detecting or quantifying an analyte in a specimen; and detecting or contantifying an analyte specific moiety, contacting the contantify the amount of (III) or (III) is useful for (III) or (III) with a specimen suspected of containing the analyte, and measuring the amount of (III) or (III) bound to analytes in the specimen contacting the analyte with sensitivity. In (I), the multiple labeled groups increases the amount of signal that is added to the analyte specific moiety, the amount of signal that is added to the analyte of charged groups increases the groups to a desirable target and the presence of charged group increases contacting or account of containing the multiple labeled groups to a desirable target and the presence of charged group increases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
Composition of multi signal labeling reagents, useful for detecting or quantifying analyte in specimen, has oligomer/polymer having labeled moieties, reactive groups and charged groups linked to oligomer/polymer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis C virus (HCV) NS5B replicase RNA synthesis template #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to a replicase complex comprising a hepatitis C virus (HCV) NSSB replicase protein, a linear nucleic acid template and a complementary nucleic acid primer which is annealed to the 3' terminus of the template, where the template is at least three nucleotides and the complementary nucleic acid primer which is annealed to the 3' terminus of the template, where the template is at least three nucleotides and the complex is two or three nucleotides, and the template and primer do not complex is useful for detecting HCV replicase activity and permits catablishment of sensitive RNA-dependent RNA polymerase assays to screen and evaluate antiviral inhibitors and to improve the specificity and efficacy of the inhibitors. The complex is also useful in the development of a reliable system for determining kinetic and thermodynamic constants of HCV MSSB-catalysed nucleotide incorporation and investigation of mechanistic inhibitors for mis-incorporation and ultimately in the specifically, the short RNA template and primer pairs are useful in screening assays which are used for determining kinetic, thermodynamic development of inhibitors of NSSB replication and ultimately in the catablicase activity may be used for developing anti-HCV pharmaceuticals. Novel replicase complex comprising hepatitis C virus NSSB replicase, a 3 nucleotide-long template to which a 2 nucleotide-long primer is annealed, and template and primer which do not form a stable duplex in the absence of HCV NSSB. template with unstable, small stemloop capable of forming copy-back structure, viral non-structural protein 5B, nucleoside triphosphates Assay system for hepatitis C virus replicase activity comprises RNA

Example 1; Fig 1A; 10pp; English.

The present invention relates to an assay system for hepatitis C virus (HCV) replicase activity. The assay system comprises an RNA template that has an unstable, small stemloop at the 3' end capable of forming a copyback structure, a HCV non-structural protein 5B (NSSB), ATP, GTP, CTP, and UTP nucleoside triphosphates (NTPS), where one of the NTP is caid-labelled and an assay buffer that supports replication activity of NSSB. The invention also relates to the identification of optimal properties of an RNA template for copy-back self-priming RNA synthesis of HCV. This activity can be used to screen for anti-HCV replicase compounds or to characterise the biological relevance of lead compounds. The coptimal RNA templates can be used for developing a system to characterise HCV NSSB polymerase mechanistically and kinetically and for designing CT from the invention is useful for developing a system to characterise correction products separated by gel electrophoresis. The structuradiograph of reaction products separated by gel electrophoresis. The present sequence is RNA template, AU used to direct RNA synthesis by RNA copymerase proteins of HCV, BVDV and polivirus. This sequence is used in the exemplification of the invention

Assay system for hepatitis C virus replicase activity comprises RNA template with unstable, small stemloop capable of forming copy-back structure, viral non-structural protein 5B, nucleoside triphosphates buffer.

Example 1; Fig 2A; 10pp; English.

```
Hey replicase activity. The assay system comprises an RNA template that has an unstable, small stemloop at the 3' end capable of forming a copyhac tructure, a HVV non-structural protein SB (NSSB), ATP, GTP, CTP, and UTP nucleoside triphosphates (NTPS), where one of the NTP is radiolabelled and an assay buffer that supports replication activity of radiolabelled and an assay buffer that supports replication activity of SSB. The invention also relates to the identification of optimal properties of an RNA template for copy-back self-priming RNA synthesis of HVV. This activity can be used to screen for anti-HVV replicase compounds or to characterise the biological relevance of lead compounds. The cort contacterise the biological relevance of lead compounds. The cort to characterise mechanistically and kinetically and for designing system to characterise captement occrystallise with HCV NSSB polymerase. The assay stem of the invention is useful for detecting HCV replicase activity. The nucleic acid synthesised by NSSB is detected by evaluating an autoradiograph of reaction products separated by gel electrophoresis. The present sequence is RNA template, (AU) 2 used to direct RNA synthesis by the average of the invention of the invention of the invention of the invention and the invention products separated by gel electrophoresis. The average proteins of HCV, BVDV and polivitus. This sequence is used in the average.

Robertson JG; 3 Synthetic nucleic acid probes - comprising two nucleic acid sequences linked by a scissile linkage.

The patent claims a new molecule of formula (NA1----S----NA2)n. NA1 and NA2 are noncomplementary nucleic acid sequences; ---S-- a scissile linkage; n= 1 or 1,000, which is used for the detection of specific DNA or NNA sequences in a test soln. The acissile link probes may be PL (Permanent Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid Example, p29; 46pp; English.

```
ö
Support). The differential liability of DNA and RNA may be exploited in a heterogenous system when the scissile linkage is an RNA molecule. In the examples, counter probe molecules 9 through 16 were used to determine suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing

Disclosure; Page 24; 34pp; English.

Probe MRCO68 is bound by a hydrolysable linkage to a solid support at its 3 and. It is used by reacting excess probe with a target nucleic acid; nicking hybridised probe at least once within a predetermined sequence to form 2 or more probe fragments hybridised to the target sequence, which results in the probe fragments becoming hybridised to another probe; and identifying probe fragments, so detecting the target sequence. The probe can react with target sequence to complete a cycling sequence. The probe system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polymerase and dNTPs meessary for repetitively replicating the tandem repeat. The method involves detecting a binding event between first and second binding members, employing a label to determine the occurrence of the binding members, employing a label to determine the occurrence of the binding event. The tandem repeating units are polyT. The method of the invention is useful in detecting an analyte using repetitive extension along a tandem repeat. The extended nucleic acid may be used for detecting a moiety, particularly involved in a binding event employing a reagent. The current sequence represents a template member oligonucleotide containing a polyT tandem repeat that binds to the extendable oligonucleotide given in ADG33444.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting a label comprising employing (as the label) a reagent having a 's extendable terminus hybridized to a tandem repeat template in combination with a DNA polymerase and dNTPs necessary for repetitively replicating the tandem repeat.

This sequence represents a PCR primer used to determine the full length cDNA sequence of the swine vesicular disease virus (SVDV) gene sequence of Taiwan Yu-Li strain (see AAZSBTT). SVDV is the causarive agent of swine vesicular disease, which is very similar to foot and mouth disease. The invention relates to the wild-type Taiwan Yu-Li strain cDNA sequence, and the gene sequences of the mutant SVDV strains N3, H21 and SP7. The mutant SVDV nucleotide sequence can be used in a vaccine for the prophylaxis of swine vesicular disease. The invention also includes a method for differentiating the mutant SVDV nucleotide sequences from the wild type strain of SVDV, coxsackievirus and foot-and-mouth disease virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mutant strains of swine vesicular disease virus (SVDV) used in vaccines

                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents an oligonuclectide used in an example of the present invention. The present invention describes a method for synthesising a selected oligonuclectide (I) having well defined ends. The method comprises: (a) annealing a primer to a single-stranded (ss) circular template to yield a primed circular template, where the template comprises: (i) at least one nucleotide effective to produce a cleavage site in the cligonuclectide multimer; (b) combining the primed circular template with at least two types of nucleotide ffective to produce a cleavage site in the cligonuclectide two types of nucleotide triphosphates and a polymerase enzyme without the addition of auxiliary proteins to yield a ss oligonucleotide multimer complementary to the circular oligonucleotide template, comprising multiple copies of (I); and (c) cleaving the oligonucleotide cultimer at the cleavage site to produce (I) having well defined ends. The method is used for the large-scale synthesis of box and RNA oligomers for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                      Rolling circle synthesis of oligo:nucleotide(s) - using primed circular template to produce oligonucleotide multimer for cleavage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         therapeutic agents

                                                                                                                                                              The present invention describes a detectably labelled oligonucleotide multimer, comprising multiple contiguous copies of a repeated oligonucleotides. The detectably labelled oligonucleotide multimer is useful for detecting a trarget molecule. Oligonucleotide multimers may be produced in sufficient quantity to be useful for diagnostic and medical applications. The multimers are useful for affinity labelling of proteins, and for signal amplification in highly sensitive affinity acapture and sequence identification applications. The method provides a faster, cheaper and simpler way for large-scale production of DNA and Allogomers and multimers. The incorporation of labels enables the oligonucleotide multimers to be useful in diagnostics and medicine. The present sequence represents an oligonucleotide used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HPV infection; replication; cytostatic; virucide; cervical dysplasia; carcinoma; oral mucosal cancer; laryngeal; vaccine; gene therapy; double internal trans-acting ribozyme; single; dITRz; ITRz; CHOP portion;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating human papilloma virus (HPV) infection, e.g. cervical dysplasias or HPV-associated cervical carcinoma, comprises administering to a patient a nucleic acid molecule that inhibits expression associated with HPV replication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3' flanking RNA of IT ribozyme (Rz) from CHOP portion of SNIPAA cassette.

The invention relates to a novel method for treating Human papillomavirus (HPV) infection comprising administering to a patient a nucleic acid molecule that inhibite sexpression associated with HPV replication. The method of the invention has cytostatic and virucide applications and may including ervical dysplasia, cervical excrinema, oral mucosal cancer and laryngeal cancer. Furthermore, the method may be utilised during vaccine production and gene_therapy. The current sequence is that of the HPV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid molecules from the human genome which include polymorphic sites, useful in methods for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel method for parallel sequence analysis of nucleic acids (NA) by optical means using a novel solid phase (SP). The SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids, so the background remains low even after prolonged and respected contact of the solid phase with high concentrations of labeled reagents. The present sequence is that of an oligonucleotide which was used in the development of the novel method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Parallel sequencing of nucleic acids by optical methods, by cyclic primer -matrix extension, using a solid phase with reduced non-specific binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to the identification of nucleic acid molecules (AAI29513-AAI3114) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity testing

This invention relates to a novel method for parallel sequence analysis of nucleic acids (NA) by optical means using a novel solid phase (SP). The SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids, so the background remains low even after prolonged and respected contact of the solid phase with high concentrations of labeled reagents. The present sequence is that of an oligonucleotide which was used in the development of the novel method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Parallel sequencing of nucleic acids by optical methods, by cyclic primer -matrix extension, using a solid phase with reduced non-specific binding of labeled components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA chip; biochip; DNA detection; DNA microarray; DNA sequencing; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel method for parallel sequence analysis of nucleic acids (NA) by optical means using a novel solid phase (SP). The SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids, so the background remains low even after prolonged and respected contact of the solid phase with high concentrations of labeled reagents. The present sequence is that of an oligonucleotide which was used in the development of the novel method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Parallel sequencing of nucleic acids by optical methods, by cyclic primer -matrix extension, using a solid phase with reduced non-specific binding of labeled components.
                                                                                                                                                                                                                                          88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

This invention relates to a novel surface of a solid phase (SP), useful in methods for parallel analysis of many individual nucleic acids (NA) by optical methods. The novel SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids. The present sequence is that of an oligonucleotide which was used in the development of the novel solid
                                                                                                                   Surface of solid phase, useful for parallel, optical analysis of many nucleic acids, has reduced non-specific binding of labeled components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Surface of solid phase, useful for parallel, optical analysis of many

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel surface of a solid phase (SP), useful in methods for parallel analysis of many individual nucleic acids (NA) by optical methods. The novel SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids. The present sequence is that of an oligonucleotide which was used in the development of the novel solid
                                                                                                                                                                                                                                                                                                     of solid phase, useful for parallel, optical analysis of many acids, has reduced non-specific binding of labeled components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA chip; biochip; DNA detection; DNA microarray; DNA sequencing; ss

                                 This invention relates to a novel surface of a solid phase (SP), useful in methods for parallel analysis of many individual nucleic acids (NA) by optical methods. The novel SP is useful for multiple parallel sequencing of nucleic acids and shows reduced non-specific binding of labeled or unlabeled nucleotides and nucleic acids. The present sequence is that of an oligonucleotide which was used in the development of the novel solid phase of the invention.
                                                                                                                                                                                                                                                                                                                                                                                              /*tag= b

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel solid support surface for parallel analysis of many individual nucleic acids by optical methods. The invention also describes; a) a solid phase in which the surface shows
nucleic acids, has reduced non-specific binding of labeled components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Surface of a solid support, useful for multiple parallel analysis of nucleic acids by optical methods, having low non-specific binding of labeled components.

cc reduced non-specific binding of labeled components; b) methods for preparing the novel solid support and c) methods of parallel analysis of many nucleic acid by optical methods, using the solid support. The solid support is made of silica, glass, silicon dioxide or silven, is flat and has nucleic acid chains fixed to it, optionally controved the solid phase is preferably part of a device that allows fluid exchange and it is permeable to light in the wavelength callows fluid exchange and it is permeable to light in the wavelength regions 200-400; 202-2000 or 400-800 nm. An external layer of solid support is removed, then the nucleic acid is coupled to it, optionally after attachment of a linker layer. Alternatively, after removing the coupling, optionally after attachment of a linker, and in either case, additional substances (specifically phosphate, sulfate or carboxy-coupling, optionally after attachment of a linker, and in either case, additional substances (specifically phosphate, sulfate or carboxy-coupling, optionally after attachment of synthesis of nucleic acids. Only part of the surface is attachment or synthesis of nucleic acids. Only part of the surface is cattachment or synthesis of nucleic acids. Only part of the surface is or attachment or synthesis of nucleic acids. Only part of the surface is or additional subsequent setpes are done in a liquid phase. The nucleic acids analyzed represent a single population or many different populations and contains 5-50, 20-200 or 50-500 nucleotides. The linker is 1-50 nm long cadeoxytho-nucleoside triphosphates, in which the label is cleavable. Contains 5-50, 20-200 or 15-500 nucleotides. The linker is 1-50 nm long cadeoxytho-nucleoside triphosphates, in which the label is cleavable. Catternatively the nucleic acid sequences that surface is acid sequences that surfa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. Further claimed is that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide dt31-NH2 which was used in the development of the novel process of the invention.
                                                                                                                                                                                                    Optical fluorescent parallel process to analyse nucleic acid chains in which a sample solid is bound with a primer-matrix complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ss; dna detection; DNA sequencing; DNA amplification; oligo dT31-Si(O.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. Further claimed is that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide Cy3-dt31- which was used in the development of the novel process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                      Optical fluorescent parallel process to analyse nucleic acid chains in which a sample solid is bound with a primer-matrix complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. Further claimed is that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide d731-51(0 which was used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Optical fluorescent ultra-high parallel process to analyse nucleic acid chains in which a sample solid is bound with a primer-matrix complex.
                                fluorescent parallel process to analyse nucleic acid chains in sample solid is bound with a primer-matrix complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ss; dna detection; DNA sequencing; DNA amplification; oligo Cy3-dt31-.

```
This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. The present development of the novel process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Optical fluorescent ultra-high parallel process to analyse nucleic acid chains in which a sample solid is bound with a primer-matrix complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ss; dna detection; DNA sequencing; DNA amplification; oligo dt31-NH2.

This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their

co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. The present sequence is that of oligonucleotide dt31-NH2 which was used in the development of the novel process of the invention.

Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction. Marked nucleotides washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. Further claimed is that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide dt31-NH2 which was used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ultra-high parallel analysis process to analyse nucleic acid chains in which a sample solid is bound and substrate material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ss; dna detection; DNA sequencing; DNA amplification; oligo dt31-NH2.

This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. Further claimed is that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide dT31-Si(O which was used in the development of the novel process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ultra-high parallel analysis process to analyse nucleic acid chains in which a sample solid is bound and substrate material.
                                                                                                                                   88; dna detection; DNA sequencing; DNA amplification; oligo dT31-Si(O.
                                                                                                Optical DNA analysis process-related oligonucleotide dT31-Si(O-Me)3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 31 BP; 0 A; 0 C; 0 G; 31 T; 0 U; 0 Other;

This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. Further claimed is that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide Cy3-dt31-which was used in the development of the novel process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ultra-high parallel analysis process to analyse nucleic acid chains in which a sample solid is bound and substrate material.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                  Determining the presence of severe acute respiratory syndrome coronavirus (SARS-CoV) in a test sample, useful for diagnosing SARS, comprises contacting a test sample with a specific probe and determining hybrid
                                                                                                                                                                                                                                                                                                                                       The specification describes a method for determining the presence of severe acute respiratory syndrome coronavirus (SARS-CoV) in a test sample. The method comprises contacting a test sample with a probe and determining whether the hybrid is present in the test sample as an indication of the presence of SARS-CoV in the test sample. The method is useful for distinguishing the presence of SARS-CoV from that of human coronavirus strains 229 and OC43. The method is useful for diagnosing SARS or for monitoring the therapeutic treatment of a SARS-CoV-infected individual. The detection probes of the invention are useful as amplification oligonucleotides or helper oligonucleotides. The present sequence represents a homopolymer tail with a flexible linker for use
                   severe acute respiratory syndrome; SARS; SARS-CoV; human coronavirus; human coronavirus strain 229B; human coronavirus strain OC43; SARS infection; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            BXBXGXXXXX
```

```
New detection probe, useful for determining or screening for the presence of Trichomonas vaginalis in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a detection probe, for determining the presence of Trichomonas vaginalis in a test sample, the probe being up to 100 bases in length and comprising a target binding region which forms a hybrid stable for detection with a sequence contained within any of the [6 (first) target sequences of 26-32 bp under stringent hybridization conditions, where the probe does not form a hybrid stable for detection with nucleic acid derived from Trichomonas tenax under the cited conditions. The detection probe, oligonucleotide, composition, methods, and kits are useful for determining the presence of T. vaginalis in a test sample. This sequence corresponds to a target capture probe for the T. vaginalis DNA and used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA detection, diagnosis, prognosis, DNA amplification, prostatic cancer, cytostatic, PCA3; probe, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnosing or prognosing prostate cancer in a patient comprises amplifying RNA on PCA3 gene using specific primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò

The invention describes diagnosing or prognosing prostate cancer in a patient comprising amplifying a prostate cancer specific PCA3 RNA using a patient comprising and detecting an amplification product derived from it, where the amplification product is associated with a presence of prostate cancer or predisposition to prostate cancer in the patient. Also described is a diagnostic kit comprising a first container containing a first pair of primers designed to amplify a PCA3 RNA across an exon junction of a PCA3 gene. The method and kit are useful for diagnosing or prognosing prostate cancer in a patient. This sequence represents a probe used to detect an exon-exon junction to detect PCA3 mRNA

New phospho:di:esteric oligo:nucleotide(s) - which exert a specific and selective cytotoxic effect on tumour cells, for treating both solid and Claim 10; Page 6; 38pp; English. liquid tumours.

Novel phosphodiesteric oligonucleotides AAT93811-27 are based on the generic formula, in the 3'-5' or 5'-3' direction: (GaTa')a''-(GDTb')b''- (GGTc')a''-(GTTd')d''-(GGTe')a''-(GTTd')d''-(GTTG')a''-where: N and N' = T or G, equal or different from each other; x = 0-8, equal or different from each other; a, b, c, d, e, f, and g = 0-10, equal or different from each other; a', b', c', d', e', f', and g' = 0-30, equal or different from each other; a', b', c', d', e', f', and g' = 1-16, equal or different from each other; a', b', c', d', e', f', and g' = 1-16, equal or different from each other; The oligonucleotides are believed

to selectively bind and sequester some proteins which are essential to the viability and growth of tumoural cell line. They have specific and selective cytotoxic activity against tumour cells, and can be used for treating tumours of the liquid type, in particular of lymphoblastic origin, and of solid type, in particular lymphomas. The present phosphodiester oligonuclectide, at a concentration of 15 micromolar, reduced growth of CCRF-CEM tumoural cells by 71%, which is detectable 48 hours after administration. (Updated on 25-MAR-2003 to correct PR field.)

Assay system for hepatitis C virus replicase activity comprises RNA template with unstable, small stemloop capable of forming copy-back structure, viral non-structural protein 5B, nucleoside triphosphates. buffer.

Example 1; Fig 2A; 10pp; English.

The present invention relates to an assay system for hepatitis C virus C (HCV) replicase activity. The assay system comprises an RNA template that has an unstable, small stemloop at the 3 ' end capable of forming a copylack structure, a HCV non-structural protein 5B (NS5B), ATP, GTP, GTP, C and UTP nucleoside triphosphates (NTPS), where one of the NTP is activity of radiolabelled and an assay buffer that supports replication activity of NS5B. The invention also relates to the identification of optimal properties of an RNA template for copy-back self-priming RNA synthesis of HCV. This activity can be used to screen for anti-HCV replicase compounds. The C representation of comparates can be used for developing a system to characterise the biological relevance of lead compounds. The C representation of the invention is useful for developing a system to characterise the invention is useful for detecting HCV replicase activity. Semila RNA molecules to co-crystallise with HCV NS5B polymerase. The assay system of the invention is useful for detecting HCV replicase activity. The nucleic acid synthesised by NS5B is detected by evaluating an

```
The present invention describes a nucleic acid segment of 10-100 contiguous bases chosen from one of 632 fragments (AAA78631 to AAA79262), where the segment comprises a polymorphic site or an immediately adjacent base, or the complement of the segment. Also described are: (1) an allelesspecific oligonucleotide that hybridises to a segment of the novelty; (2) an isolated nucleic acid comprising a sequence of the novelty where the polymorphic site within the sequence is occupied by a base other than the reference base indicated in the specification; and (3) analysing a nucleic acid, comprising obtaining a nucleic acid from an individual, and determining a base occupying any one of the polymorphic sites of the novelty. The nucleic acid segments and method can be used to analyse an individuals nucleic acid segments and method can be used to test for a disease phenotype and correlate the correlation of the phenotype with a particular polymorphism. The presence of polymorphic sites are useful for, e.g. forensics, paternity testing, correlation of phenotypic traits, AAA78631 to AAA79262 represent sequence correlation of phenotypic traits. AAA78631 to AAA79262 represent sequence of base occupying the polymorphic sites indicated using IUPAC-IUB
                                                                                                                                                                                             ö
autoradiograph of reaction products separated by gel electrophoresis. The present sequence is RNA template, (AU)3 used to direct RNA synthesis by RNA polymerase proteins of HCV, BVDV and polivirus. This sequence is used

The present invention describes a nucleic acid segment of 10-100 contiguous bases chosen from one of 632 fragments (AAA78631 to AAA79262), where the segment comprises a polymorphic site or an immediately adjacent base, or the complement of the segment. Also described are: (1) an allelerspecific oligonucleotide that hybridises to a segment of the novelty; (2) an isolated nucleic acid comprising a sequence of the novelty where the polymorphic site within the sequence is occupied by a base other than the reference base indicated in the specification; and (3) analysing a cucleic acid, comprising obtaining a nucleic acid from an individual, and determining a base occupying any one of the polymorphic sites of the covelty. The nucleic acid segments and method can be used to analyse an individuals nucleic acid segments and method can be used to test for a disease phenotype and correlate the presence of the phenotype with a particular polymorphism. The presence of polymorphisms with phenotypic traits and for genetic mapping of phenotypic traits. AAA78631 to AAA79262 represent sequence tags of human genomic DNA fragments containing polymorphic sites. The presence of buse occupying the polymorphic site is indicated using IUPAC-IUB

where the segment comprises a polymorphic site or an immediately adjacent
base, or the complement of the segment. Also described are: (1) an allele
capecific objigonucleotide that hybridises to a segment of the novelty.

capecific objigonucleotide that hybridises to a segment of the novelty.

capecific objigonucleotide that hybridises of the novelty where
capecific objigonucleotide that hybridises as sequence of the novelty where
capecific objigonucleotide that hybridises and by a base other than
the sequence is occupied by a base other than
the specification; and (3) analysing a
nucleic acid, comprising obtaining a mucleic acid from an individual, and
capecific occupying any one of the polymorphic sites of the
coverlay. The nucleic acid sequences for the presence of polymorphic sites of the
coverlay. The nucleic acid sequences for the presence of polymorphisms. The
coverlay of the phenotype with a particular polymorphism. The presence of
polymorphic sites are useful for, e.g. forensics, paternity testing,
correlation of polymorphisms with phenotypic ratals and for genetic
apping of phenotypic traits. AAA78631 to AAA7262 represent sequence
tags of human genomic DNA fragments containing polymorphic sites. The

contiguous bases chosen from one of 632 fragments (AAA78631 to AAA79262), where the segment comprises a nucreate or an immediately adjacent where the segment comprises a polymorphic site or an immediately adjacent base, or the complement of the segment. Also described are: (1) an allele capecific oligonuclectide that hybridises to a segment of the novelty; (2) an isolated nucleic acid comprising a sequence of the novelty where the polymorphic site within the sequence is occupied by a base other than the reference base indicated in the specification; and (3) analysing a nucleic acid, comprising obtaining a nucleic acid from an individual, and determining a base occupying any one of the polymorphic sites of the novelty. The nucleic acid sequences for the presence of polymorphisms. The conventy and the sequence for the presence of polymorphisms. The presence of the phenotype with a particular polymorphism. The presence of the phenotype with a particular polymorphism. The presence of polymorphisms with a particular polymorphism. The presence of the phenotypic traits. AAA78631 to AAA79262 represent sequence of human senomic sequence of thusen secondariance of presence of human senomic sequence of the phenotypic traits. AAA78631 to AAA79262 represent sequence of human secondariance of the presence of human secondariance of the presence of presence of presence of presence of polymorphisms with phenotypic traits and for genetic traits the presence of human secondariance of the presence of polymorphisms with phenotypic traits and for genetic traits the presence of presence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                    Human; genomic DNA; polymorphism; genome; allele-specific; primer; probe; hybridisation; polymorphic site; forensic; paternity testing; medicine; phenotypic trait; genetic analysis; genetic mapping; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human genomic polymorphic nucleic acid segments, allele specific primers and probes, and methods of analysis, useful for e.g. forensics, paternity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present invention describes a nucleic acid segment of 10-100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           base occupying the polymorphic site is indicated using IUPAC-IUB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
